by Menghi. or simply, "El discreto encanto de la burguesÃa" is a 1901 prose narrative by Spanish author Benito PÃºrez GaldÃ³s, originally published in two parts in the monthly review *Semana* from the second quarter of 1901 and first printed as a whole as part two of the novel *El Revisor* (1905).

Q: Error while piping data I have two files, one contains string with some values:
check.txt bla bla val1|val2|val3 bla bla val4|val5|val6|val7 bla bla val8|val9|val10|val11 and I wanna get this values, but I get error: `cat check.txt | xargs grep -o "[a-zA-Z0-9]*"` grep: [i:] No such file or directory If I do it this way I get all rows in one line. `cat check.txt | grep -o "[a-zA-Z0-9]*"` bla bla val1|val2|val3 bla bla val4|val5|val6|val7 bla bla val8|val9|val10|val11 If I do `grep`

this way: `cat check.txt | grep -o "[a-zA-Z0-9]*"` I get whole file as output, but I need only the first values: bla bla val1
bla bla val2 bla bla val3 bla bla val4 bla
bla val5 bla bla val6 bla bla val7 bla bla
val8 bla bla val9 bla bla val10 bla bla
val11 So, how to use pipes to get exactly
what I want? A: Use: `cat check.txt | grep
-o '[a-zA-Z0-9]*'` The "problem" is that
grep -o is looking for a file called [i:]
after an a-zA-Z0-9*. But the shell is
expanding the [i:] into an empty string. I
suggest

duration of the study). Of 62 patients enrolled in step 1, 27 (44%) were to receive AZT, and 35 (56%) were to receive placebo. Of the 137 subjects enrolled in step 2, 58 (42%) received AZT, and 79 (58%) received placebo. Patients were enrolled after they had experienced one or more adverse event. For each patient in the placebo group, and each patient in the AZT group who had experienced ≥ 1 adverse event, the occurrence of subsequent adverse events was recorded. Occurrence of new adverse events, development of new complications of already existing adverse events, and any subjective symptoms of these events. Data were analyzed using analysis of variance and the chi 2 test. Step 1 results showed that patients in the AZT group tended to develop fewer new adverse events than did patients in the placebo group. Step 2 results showed that patients in the AZT group who had experienced ≥ 1 adverse event were more likely to experience no new adverse events while on placebo, and were more likely to experience new adverse events while on
