Can I use any standard.NET Framework 1.1, 1.2, 2.0 or 3.5 version? A: .NET 2.0 is an old platform and the target.NET framework version is lower than 3.5. You can still target.NET 2.0 if your target framework is higher than 2.0. The VS.NET Framework version is always higher than the targeted framework. A Visual Studio 2005 can be used, but it is not supported for more than a year. A Visual Studio 2008 is better. So choose the version from a later version. Understanding the dielectric properties of aqueous solutions of poly(acrylic acid): the role of salt. The dielectric properties of poly(acrylic acid) (PAA) solutions in water at pH 1.6 are investigated at 10 Hz to 200 MHz. The results are compared to those obtained for solutions of poly(diallyldimethylammonium chloride) (PDADMAC) in water at pH 1.6. The dielectric relaxation of the PAA solutions exhibit two processes, corresponding to distinct relaxation times (τ_1

A typical crystal for use as a substrate material for various thin-film devices such as a magnetic head, semiconductor device, or optical device must have strict specifications such as flatness, size, strain, uniformity and orientation. For example, it is required that a substrate of a magnetic disk for a hard disk drive exhibit a surface roughness Ra (average roughness) of not more than 0.2.Âµm. and a biaxial orientation ratio of 0.6 or more. Most substrates for magnetic disks are produced by a rolling method. In this method, a raw material of a large silicon single crystal, for example, is rolled into a cylindrical shape, and then sliced into wafers. Alternatively, a large silicon single crystal is sliced into wafers, and then subjected to orientation and

polishing. If the wafer is of a large diameter (having a diameter of, for example, 8 inches or more), then the surface of the wafer is processed to satisfy the above-described requirements by forming and removing a substrate layer on one surface of the wafer by polishing or etching. Japanese Unexamined Patent Publication No. 62-101971 discloses a method for producing a disk substrate by subjecting a large silicon single crystal ingot to hydrostatic-pressure-induced orientation. In this method, the ingot is rotated, pressed with pistons to apply hydrostatic pressure thereto, and then rotated to carry out an orientation step. However, since the substrate produced by the conventional rolling method described above has a surface roughness Ra of 0.3 to 0.5.ANG., it is necessary to polish or etch the surface of the substrate layer in order to reduce the surface roughness to
