bugs fixed. Structure and function of terminal Trp residues in plant defensins. Most plant defensins contain two to four conserved Trp residues in their C-terminal region, called terminal Trp residues, and are known to be involved in antimicrobial activity. The present study demonstrates that these Trp residues interact with lipid membrane regions by using the spin-label

technique. The structures of terminal Trp residues in the defensins from white sweet potato and rice have been examined by electron spin resonance (ESR) spectroscopy and mass spectrometry. The root defensin from white sweet potato and rice contains a single Trp residue at the C-terminal end, which corresponds to Asp-21 in the antimicrobial cyclotide protein nodulin 52. The

ESR spectrum of white sweet potato defensin is similar to that of nodulin 52, whereas the ESR spectrum of rice defensin is similar to that of lysozyme, indicating that these Trp residues are involved in the interaction of the C-terminal end of defensins with lipid membrane regions.1.

Field of the Invention

The present invention relates generally to electrophotographic

printing devices, and more particularly to a photoreceptor belt used in such printing devices.

2. Description of the

Prior Art In general, a typical photoreceptor

belt used in an

electrophotographic printing device has a

core having a

photoconductive layer on the surface thereof.

Such photoconductive layer, which may be in the form of a conductive rubber or a resistive

photoconductor, may be used for generating an electrostatic latent image, which is later developed and transferred to a paper sheet. In a typical belt drive electrophotographic printing device, a photoreceptor belt is driven to rotate around a plurality of rollers. While rotating, the photosensitive belt is charged to a constant potential. Radiation is

then passed over the charged photoreceptor belt which modifies the radiation passing therethrough, producing an electrostatic latent image on the photoreceptor surface. Following development of the electrostatic latent image into a toner image, the toner image is transferred from the photoreceptor belt to a paper sheet which is then heated to permanently
