In security-conscious societies, such as those in developing countries, timely detection of unknown subjects is a common task. One type of unknown person detection task is called passive person detection (PPD), a scenario in which a monitor or camera captures an unknown or suspicious person in a predefined environment and automatically detects the presence of this unknown person without the help of any person-detection algorithm. In this paper, we present an information-theoretic-based study to examine the security and privacy of PPD. The main results indicate that the PPD process makes use of a secret key that is unknown to the unknown subject. A theoretic analysis also suggests that the quality of PPD can be affected by several factors, such as the quality of an image, the distance between the known and unknown subjects, and the maximum number of existing subjects. To compensate for these factors, we introduce a PPD method using a multi-feature vector that contains both high-contrast and low-contrast information. The experimental results show that the multi-feature vector-based PPD method outperforms other state-of-the-art algorithms on the PPD task.I. Field of the Invention The present invention generally relates to the magnetic resonance arts. More particularly, the invention relates to magnetic resonance imaging (MRI) systems and methods. II. Description of the Related Art MRI systems typically comprise a primary magnet that generates a strong, uniform magnetic field through an imaging volume. A series of gradient fields are then formed by superposing a set of corresponding magnetic field gradient field elements on the uniform field, and a radio frequency (RF) field is applied to excite magnetic moments in the body to be imaged. The excited magnetic moments re-orientate, releasing energy in the form of RF signals that are detected, processed and displayed as image data. Unlike many other medical diagnostic tools, such as X-ray computed tomography (CT), positron emission tomography (PET), or ultrasound, MRI is highly versatile in that it can create images of any desired slice thickness (referred to as "section thickness" or "slice thickness"), and with any contrast agent to enhance the absorption of RF signals by different soft tissues or organs within a patient
